York

Phase IB Archaeological Survey Addendum Memo

On behalf of Hoffman Falls Wind LLC, a wholly owned subsidiary of Liberty Renewables Inc., EDR conducted approximately 2 acres of additional Phase IB archaeological survey for the proposed Hoffman Falls Wind Project (the Facility) on December 20, 2023. The purpose of this memorandum is to document the results of this additional Phase IB survey.

All archaeological services provided by EDR for the Project were conducted under the supervision of a Registered Professional Archaeologist who meets the Secretary of the Interior's Guidelines (per 36 CFR, Part 61) for Professional Qualifications in Archaeology. The work was conducted in accordance with the New York Archaeological Council's Standards for Cultural Resources Investigations and the Curation of Archaeological Collections in New York State and the New York State Historic Preservation Office's (NYSHPO) Phase I Archaeological Report Format Requirements, as appropriate.

### **Project Background**

EDR completed a Phase IB archaeological survey of the Facility in the summer and fall of 2023 and submitted the *Phase IB Archaeological Survey Report* (EDR, 2023) to the New York Historic Preservation Office (NYSHPO) via the Cultural Resources Information System (CRIS) on December 13, 2023.

Since the completion of the *Phase IB Archaeological Survey Report* (EDR, 2023), Hoffman Falls Wind LLC has made minor revisions to the Facility layout, resulting in an additional 2 acres of Elevated Archaeological Sensitivity within the Area of Potential Effect that were not previously subjected to

Phase IB survey (see Figure 1, Sheets 1-3). EDR completed a supplemental survey within these 2 acres on December 20, 2023. This addendum memo has been prepared to present the results of the supplemental survey.

## Results of Additional Phase IB Archaeological Survey

On December 20, 2023, EDR Project Archaeologist Matthew Weiss and three EDR staff conducted a shovel testing survey involving the excavation of 32 shovel test pits at a 15-meter interval across approximately 2 acres of the Area of Potential Effect designated as having Elevated Archaeological Sensitivity, per NYSHPO's criteria and EDR's GIS-based archaeological sensitivity model (EDR, 2023a). Shovel test pits were 30 to 50 centimeters in diameter and were excavated to sterile subsoil or the practical limits of hand excavation (NYAC, 1994). Field data were recorded for each shovel test pit that described soil stratigraphy and recorded whether any artifacts were recovered. All soils excavated from STPs were screened through 0.25-inch hardware cloth. Shovel test pit data is included in Appendix A. During the survey, no cultural material was identified (see Figure 1, Sheets 1-3).

### **Summary and Conclusions**

Due to the lack of identified cultural material during the additional Phase IB survey, it is the opinion of EDR that no impacts to any potentially S/NRHP-eligible archaeological resources are anticipated. No further archaeological investigations are recommended.

If you have any questions or would like to discuss the information described herein, please contact me at <a href="magni@edrdpc.com">mmagni@edrdpc.com</a> or (203) 312-3008, or Doug Pippin at <a href="magni@edrdpc.com">dpippin@edrdpc.com</a> or (585) 752-6147.

Thank you very much for your time.

Sincerely,

**EDR** Project Archaeologist / Field Staff Coordinator

Moua Dagni
